College of Engineering & Computer Science COP 3402: System Software Spring 2018

Homework #2 (Lexical Analyzer)

Team assignment (Max 2 people - you must work with the same person you did in HW1)

Due Thursday, March 22nd, by 11:59 p.m.

Goal:

You have been selected to write a compiler for the PL/0 language. In this assignment you have to implement a lexical analyzer for the programming language PL/0. Your program must be capable to read in a source program written in PL/0, identify some errors, and produce, as output, the source program, the source program lexeme table, and a list of lexemes. *For an example of input and output refer to Appendix A*. The scanner must not generate the Symbol Table, which contains all of the variables, procedure names and constants within the PL/0 program. As follows we show you the grammar for the programming language PL/0 using the Extended Backus-Naur Form (EBNF).

Based on Wirth's definition for EBNF we have the following rule:

[] means an optional item,

{ } means repeat 0 or more times.

Terminal symbols are enclosed in quote marks.

A period is used to indicate the end of the definition of a syntactic class.

EBNF of PL/0:

```
rel-op ::= "="|"<>"|"<="|">=".
expression ::= ["+"]"-"] term \{ ("+"]"-" \} term \{ ("+"]"-" \}.
term ::= factor \{("*"|"/") \text{ factor}\}.
factor ::= ident | number | "(" expression ")".
number ::= digit {digit}.
ident ::= letter { letter | digit }.
digit ::= "0" | "1" | "2" | "3" | "4" | "5" | "6" | "7" | "8" | "9".
letter ::= "a" | "b" | ... | "y" | "z" | "A" | "B" | ... | "Y" | "Z".
Example of a program written in PL/0:
var x, w;
begin
  read w:
 x := 4;
  if w > x then
       w := w + 1
  else
       w := x;
  write w;
end.
Lexical Conventions for PL/0:
A numerical value is assigned to each token (internal representation) as follows:
nulsym = 1, identsym = 2, numbersym = 3, plussym = 4, minussym = 5, multsym = 6,
slashsym = 7, oddsym = 8, eqlsym = 9, neqsym = 10, lessym = 11, leqsym = 12,
gtrsym = 13, gegsym = 14, lparentsym = 15, rparentsym = 16, commasym = 17,
semicolonsym = 18, periodsym = 19, becomessym = 20, beginsym = 21, endsym = 22,
ifsym = 23, thensym = 24, whilesym = 25, dosym = 26, callsym = 27, constsym = 28,
varsym = 29, procsym = 30, writesym = 31, readsym = 32, elsesym = 33.
Reserved Words: const, var, procedure, call, begin, end, if, then, else, while, do, read, write.
Special Symbols: '+', '-', '*', '/', '(', ')', '=', ', ', ', ', ', ', ', ';', ':'.
Identifiers: identsym = letter (letter | digit)*
Numbers: numbersym = (digit)<sup>+</sup>
Invisible Characters: tab, white spaces, newline
Comments denoted by: /* . . . */
```

Refer to Appendix B for a declaration of the token symbols that may be useful.

Constraints:

Input:

- 1. Identifiers can be a maximum of 11 characters in length.
- 2. Numbers can be a maximum of 5 digits in length.
- 3. Comments should be ignored and not tokenized.
- 4. Invisible Characters should be ignored and not tokenized.

Important Note: Input files may NOT be grammatically valid PL/0 code.

Output:

- 1. The token separator in the output's Lexeme List (Refer to Appendix A) can be either a space or a bar ('|').
- 2. In your output's Lexeme List, identifiers must show the token and the variable name separated by a space or bar.
- 3. In your output's Lexeme List, numbers must show the token and the value separated by a space or bar. The value must be transformed into ASCII Representation (as discussed in class)
- 4. Be consistent in output. Choose either bars or spaces and stick with them.
- 5. The token representation of the Lexeme List will be used in the Parser (HW 3). So, PLAN FOR IT!

Detect the Following Lexical Errors:

- 1. Variable that does not start with letter.
- 2. Number too long.
- 3. Name too long.
- 4. Invalid symbols.

Hint: You could create a transition diagram (DFS) to recognize each lexeme on the source program and once accepted, generate the token, otherwise emit an error message.

Submission Instructions:

Submit to Webcourse:

- 1. Source code.
- 2. Instructions to use the program in a readme document.
- 3. One run containing the input file (Source Program), and output in a file (Source, Lexeme Table (lexeme-token), Lexeme List)
- 4. This is a team assignment.

Appendix A:

If the input is:

```
var x, y;
begin
y := 3;
x := y + 56;
end.
```

The output will be:

Source Program:

var x, y; begin y :=

$$y := 3;$$

 $x := y + 56;$

end.

Lexeme Table:

lexeme	token type
var	29
X	2
,	17
y	2
y ;	18
begin	21
	2
:=	20
y := 3 ;	3
•	18
X	2
x := y + 56	20
y	2 4
+	4
56	3
•	18
end	22
	19

Lexeme List:

 $29\ 2\ x\ 17\ 2\ y\ 18\ 21\ 2\ y\ 20\ 3\ 3\ 18\ 2\ x\ 20\ 2\ y\ 4\ 3\ 56\ 18\ 22\ 19$

Appendix B:

Declaration of Token Types:

typedef enum {
nulsym = 1, identsym, numbersym, plussym, minussym,
multsym, slashsym, oddsym, eqsym, neqsym, lessym, leqsym,
gtrsym, geqsym, lparentsym, rparentsym, commasym, semicolonsym,
periodsym, becomessym, beginsym, endsym, ifsym, thensym,
whilesym, dosym, callsym, constsym, varsym, procsym, writesym,
readsym, elsesym } token_type;

Example of Token Representation:

"29 2 x 17 2 y 18 21 2 x 20 2 y 4 3 56 18 22 19"

Is Equivalent:

varsym identsym x commasym identsym y semicolonsym beginsym identsym x becomessym identsym y plussym numbersym 56 semicolonsym endsym periodsym

Appendix C:

```
Example of a PL/0 program: const m = 7, n = 85;
var i,x,y,z,q,r;
procedure mult;
 var a, b;
 begin
   a := x; b := y; z := 0;
   while b > 0 do
   begin
     if odd x then z := z+a;
       a := 2*a;
       b := b/2;
   end
 end;
begin
 x := m;
 y := n;
 call mult;
end.
```
